Abstract
We investigate the nonlinear coupled system of elliptic partial differential equations which describes the fluid motion and the energy transfer. Due to the simultaneous action of the convective-radiation effects on a part of the boundary, such system leads to a boundary value problem. We present existence results of weak solutions under different constitutive laws for the Cauchy stress tensor with $p$-coercivity parameter satisfying $p > 3n/(n+2)$, in a $n$-dimensional space, and correlated heat flux [1, 2]. If the Joule effect is neglected in the energy equation, the existence result is stated for a broader class of fluids such that $p > 2n/(n + 1)$, and related $q$-coercivity parameter to the heat flux [3].

Keywords: Non-Newtonian fluids, convective-radiative heat transfer, Joule effect, weak solution.
